OFFERING OVERVIEW

The features of the Product are:

The Local Economic Analysis Platform provides a set of dashboards that can help you visualize data for India. The pages are as below:

National: provides a set of visualisations at the India level using data on GDP and prices, money and banking, external sector, government finances and expectations. It will help the user to get a quick view of the developments in the economy.

Reports: Occasional thought leadership pieces and working papers from the PwC team will be available on the platform on current socio-economic developments.

Local Area Economic Product ("LAEP") and ancillary indicators: Official GDP estimates are available up to the district level at most. We use a new methodology to estimate a similar measure for the country's cities and villages. This is known as the Local Area Economic Product. The user can also supplement this information with other data available at the district, village, and city level, through a set of graphical and spatial visualisations. It is possible for the user to identify top districts based on an index that sums up the performance of the district along indicators of his/ her choice. Subsequently, he/she can drill down into the villages and cities contained within the district to view the LAEP.
